

# ASTRA

The Autonomous System for  
Tracking, Reconnaissance,  
and Assistance

Benjamin Kim, Curtis Ly, Pryce Matsudaira

# Table of Contents

- 1) Problem Statement
- 2) Objectives
- 3) Design Approach
- 4) Implementation & Results
- 5) Innovation & Technical Depth
- 6) Limitations & Future Work

# Demand for Autonomous Rescue Detection

## 1) The Problem

- Search and Rescue (SAR) in unpredictable environments
- Need quick detection and response

## 3) Real-World Impact

- Delays can determine life and death

## 2) Current Limitations

- SAR systems rely on manual input
- Response time puts humans at risk

## 4) Solution

- Robotic support for human rescuers
- Minimizes human effort & maximizes response efficiency

# Goals and Objectives

- Real-Time human detection
- Maintain accuracy
- Autonomous navigation
- Transmit alert signal with low latency

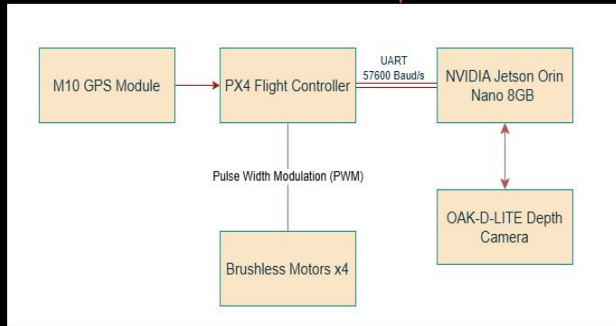

<b>Problem Identified</b>	<b>ASTRA Objectives</b>
Slow Human Detection	YOLOv8
Latency	On-board AI processing
Manual Labor	QGroundControl Autonomy

# Hardware System Integration

Power System

Processing and Control System

Ground Station

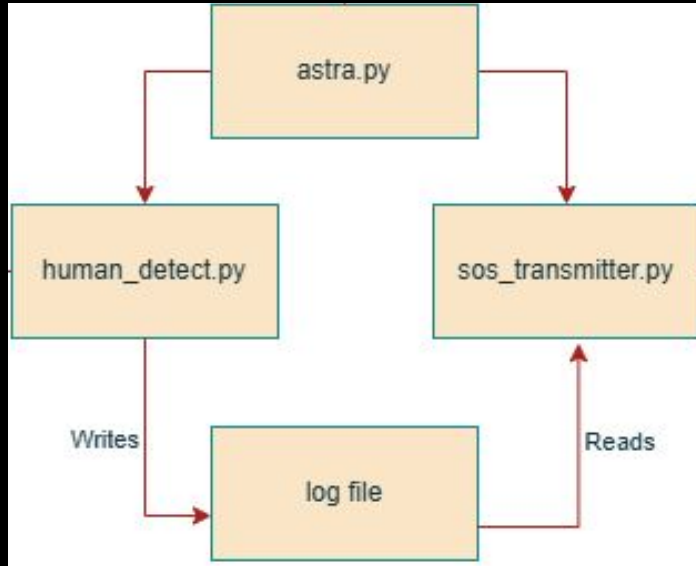

WiFi (UDP)

## Functionality

- 1) Power Distribution
- 2) Flight Control
- 3) Onboard Processing
- 4) Wireless Communication
- 5) Ground Station

# Software System Integration

## Methodology Process

- 1) Object Detection Selection
- 2) Vision Pipeline Integration
- 3) Communication Interface
- 4) Test and Improve
- 5) Final Integration

# Implementation & Results

- UAV followed predefined routes
- Real-time alerts were transmitted ( $<800$  ms)
- Live video streaming maintained  $\sim 25$  FPS
- Iterative fixes for GPS and components
- Demonstrated semi-autonomous capabilities

# Limitations & Future Work

- Improve video latency and resolution
- Wi-Fi Dependency Workaround
- Integrate Person Differentiation
- Implement full autonomy
- Flight Duration

# Thank you

Benjamin Kim, Curtis Ly, Pryce Matsudaira
